

Brooklyn Fox Interior Design

Portfolio Website for *Brooklyn Fox*, Interior Designer

Designed by *Grace Wolff*, Information Designer

Soon to be brought to web by *Kaley Wood*

1. Application Name

Brooklyn Fox Interior Design

2. Project Idea

Description

The site is built from a Figma prototype designed by a collaborating information designer based off of an interior designer's portfolio.

Rather than a conventional scrolling portfolio, it functions as a guided visual journey: the user lands on a home screen and selects one of three completed projects, each of which unfolds across a linear sequence of images. Each image offers a zoom on hover sequence creating an immersive user experience.

User Stories

- As a potential client, I want to explore Brooklyn's projects in depth so I can understand her design process from concept through construction.
- As a recruiter or employer, I want to navigate between projects and sections so I can assess range and technical skill.
- As a collaborator, I want the site to reflect Grace's design choices as the information designer while staying true to Brooklyn's design tone.
- As a visitor on any device, I want the experience to feel intentional and consistent whether I'm on mobile or desktop.

Scope and Limitations

In scope:

- Home screen with three individual project entry points
- Three projects, each with three linear sections of image content
- Hover zoom-in and click-to-full-bleed interactions on all images
- Persistent vinyl record decorative element across all views
- Responsive layout (mobile and desktop)
- Static content via local data file
- Deployed publicly on Vercel

Out of scope:

- CMS or admin dashboard for content editing
- Contact form or resume download
- Backend, authentication, or database
- Accessibility audit beyond semantic HTML basics

3. Features

Feature	User Story	Functionality Notes
Home Screen	All users	Wood-texture background, vinyl record float element, 3 project thumbnails on a shelf; click navigates to project root
Project Entry	Client / recruiter browsing work	Each project opens to its first section; back-to-home always available via home icon
Linear Section Navigation	Client following design process	Sections progress in fixed order per project; forward/back controls; no free-jumping between sections
Hover Zoom-In	All users exploring imagery	CSS scale transform on hover for all image tiles; smooth transition; signals clickability
Full-Bleed Image View	Collaborator / client reading context	Click any image to open full-viewport view; floating white text card with project description overlaid; click outside or back icon to dismiss
Persistent Vinyl Element	Brand identity across all views	Floating vinyl record rendered in consistent position per view; decorative, not interactive; repositions per screen layout
Responsive Layout	Visitor on any device	Mobile-first CSS; image grids collapse to single column; full-bleed views maintained on all screen sizes

4. Technologies

Category	Technology	Justification
Framework	Next.js (App Router)	Our course focuses on this and I want to stick with it
Styling	Tailwind CSS	Our course focuses on this and I want to stick with it
Animation	Framer Motion	Vinyl float, hover zoom, and full-bleed transition effects require declarative, physics-aware animation beyond CSS alone – I have learnt
Image Handling	next/image	Built-in lazy loading and automatic format optimization – or so I'm told
Content	Local data file	All content is static; no user input or dynamic data; Firestore would add complexity
Deployment	Vercel	Automatic preview deploys on every GitHub push
Version Control	GitHub	The queen of source control herself
Design Reference	Figma prototype	All visual and interaction decisions anchored to the provided prototype

5. Architectural Description

Pages and Routes

The app uses Next.js App Router with a nested route structure that mirrors the linear project flow. Home is the base route. Each project is a route segment, and each section within a project is a nested segment. Navigation is always linear within a project.

Route	Component	Description
/	HomePage	Hero screen: wood background, vinyl element, 3 project shelf thumbnails
/office	ProjectLayout	Office Interior entry; redirects to first section
/office/concept-imagery	SectionPage	3-panel concept image grid with click-to-full-bleed
/office/context-planning	SectionPage	2x2 render grid; hover zoom + full-bleed on each image
/office/construction	SectionPage	Floor plans, material boards, sketches, technical drawings
/cafe	ProjectLayout	Cafe Interior entry; redirects to first section
/cafe/floor-plans	SectionPage	Floor plan imagery grid
/cafe/context-planning	SectionPage	Context and planning renders
/cafe/construction	SectionPage	Construction documentation imagery
/home-interior	ProjectLayout	Home Interior entry; redirects to first section
/home-interior/floors	SectionPage	Flooring imagery grid
/home-interior/stair-construction	SectionPage	Stair construction imagery
/home-interior/elevations	SectionPage	Elevation drawings and renders

Key Components

- **HomePage** -- hero layout, wood background, vinyl float, ProjectShelf with 3 thumbnail entries
- **ProjectLayout** -- wraps a project's sections; provides home icon nav, section order config, and linear prev/next controls
- **SectionPage** -- generic section renderer; accepts an images array and section title from the project data file; renders ImageGrid
- **ImageGrid** -- displays image tiles with hover zoom-in; passes click events up to trigger full-bleed view
- **FullBleedView** -- full-viewport overlay; displays selected image with floating description card; dismisses on click-outside or back

- VinylElement -- absolutely positioned decorative element; repositioned per layout via props

Data Layer

All project and section content lives in `/src/data/projects.js`. Each project entry defines its ordered sections, image paths, and any description text shown in the full-bleed card. No database or external API is required.

6. UI Wireframe

The high-fidelity prototype created by the information designer serves as the primary UI reference for this project. All layout, interaction, and visual decisions are anchored to it directly.

Figma Prototype: [View interactive prototype](#)

Designed by Grace Wolff
Based on Brooklyn Fox's Designs

Key notes from prototype:

- Home: wood-texture background, vinyl record, 3 project thumbnails on a wooden shelf, designer name and title
- Concept Imagery: 3-panel vertical image grid on the same wood background; vinyl repositioned to corner – used for navigation
- Full-bleed image view: selected image fills the viewport; white floating card with project description overlaid bottom-right
- Context and Planning: 2x2 image grid of interior renders
- Construction: mixed grid of floor plans, material boards, hand sketches, and technical drawings
